IMU700CB

The IMU700CB is a six-degree-of-freedom (6DOF) Inertial Measurement Unit that provides accurate monitoring of linear acceleration and angular rate. The IMU700CB uses MEMSIC's third generation fiber optic rate gyro technology resulting in superior performance, reliability, and stability over time. The third generation FOG sensor provides excellent in-run bias stability of <20°/hr (constant temp) and low noise. Example applications include platform stabilization, dynamic testing and avionics.

The IMU700CB offers wide bandwidth measurement of acceleration and rotation rate about three orthogonal axes. The IMU700CB employs on-board digital signal processing to sample data, compensate for deterministic errors, and format digital and analog outputs in engineering units.

The IMU700CB sensing elements are solid-state devices that have no moving parts. The three fiber optic rate gyros employ the Sagnac effect to measure angular rate independently of acceleration. The three accelerometers are silicon MEMS devices that use differential capacitance to sense acceleration. The IMU700CB has three output options (one analog and two digital modes) to allow for easy integration into measurement and control systems.

Each Inertial System comes with a User's Manual offering helpful hints on programming, installation, and product information. In addition, MEMSIC's GYRO-VIEW software is included to assist you in system development and evaluation, and allows you to perform data acquisition.
