## F2 Torquemeter

### Description

The bearingless system consists of an one-piece measuring body manufactured from a very low hysteresis steel material. The torsion of the measuring segment is registered by means of strain gages, converted into electrical voltage signals, and then transmitted contactlessly via modulated infrared light to the stator. The master frequency is 60 kHz and the span is  $\pm 20$  kHz for  $\pm$  rated torque.

Temperature related offset shifts are minimized by an active temperature compensation. A special configured magnetic sensor provides two 90 degree phase shifted speed signals with 1024 ppr. Maximum frequency is 250 kHz. This sensor is insensitive to pollution and distortion.

An optionally available second transmission track provides an additional second torque measuring range or a multi-channel temperature transmission.
